

#Jenny

Finally I get this ebook, thanks for all these I can get now!

#Rio

Cool! I'am really happy

#Markus Jensen

I did not think that this would work, my best friend showed me this website, and it does! I get my most wanted eBook

#Hun Tsu

wtf this great ebook for free?!

#Che Salsa

My friends are so mad that they do not know how I have all the high quality ebook which they do not!

#Diego Butler

so many fake sites. this is the first one which worked! Many thanks

408 CHAPTER 15 ACIDS AND BASES

1519 Since $\text{pH} = -\log[\text{H}^+]$, we write $[\text{H}^+] = 10^{-\text{pH}}$.

- (a) $[\text{H}^+] = 10^{-2.42} = 3.8 \times 10^{-3} \text{ M}$ (b) $[\text{H}^+] = 10^{-5.66} = 2.2 \times 10^{-6} \text{ M}$
 (c) $[\text{H}^+] = 10^{-11.23} = 6.2 \times 10^{-12} \text{ M}$ (d) $[\text{H}^+] = 10^{-13.50} = 3.2 \times 10^{-14} \text{ M}$

1520 For (a) and (b) we calculate the H^+ concentration using the equation representing the definition of pH.

Strategy: Here we are given the pH of a solution and asked to calculate $[\text{H}^+]$. Because pH is defined as $\text{pH} = -\log[\text{H}^+]$, we can solve for $[\text{H}^+]$ by taking the antilog of the pH, that is, $[\text{H}^+] = 10^{-\text{pH}}$.

Solution: From Equation (15.4) of the text:

(a) $\text{pH} = -\log[\text{H}^+] = 5.20$

$\log[\text{H}^+] = -5.20$

To calculate $[\text{H}^+]$, we need to take the antilog of -5.20 .

$[\text{H}^+] = 10^{-5.20} = 6.3 \times 10^{-6} \text{ M}$

Check: Because the pH is between 5 and 6, we can expect $[\text{H}^+]$ to be between $1 \times 10^{-5} \text{ M}$ and $1 \times 10^{-6} \text{ M}$. Therefore, the answer is reasonable.

(b) $\text{pH} = -\log[\text{H}^+] = 16.00$

$\log[\text{H}^+] = -16.00$

$[\text{H}^+] = 10^{-16.00} = 1.0 \times 10^{-16} \text{ M}$

(c) For part (c) it is probably easier to calculate the $[\text{OH}^-]$ from the ion-product of water.

Strategy: We are given the concentration of OH^- ions and asked to calculate $[\text{H}^+]$. The relationship between $[\text{H}^+]$ and $[\text{OH}^-]$ in water or an aqueous solution is given by the ion-product of water, K_w (Equation (15.3) of the text).

Solution: The ion-product of water is applicable to all aqueous solutions. At 25°C,

$K_w = 1.0 \times 10^{-14} = [\text{H}^+][\text{OH}^-]$

Rearranging the equation to solve for $[\text{H}^+]$, we write

$[\text{H}^+] = \frac{1.0 \times 10^{-14}}{[\text{OH}^-]} = \frac{1.0 \times 10^{-14}}{3.7 \times 10^{-5}} = 2.7 \times 10^{-10} \text{ M}$

Check: Since the $[\text{OH}^-] < 1 \times 10^{-7} \text{ M}$ we expect the $[\text{H}^+]$ to be greater than $1 \times 10^{-7} \text{ M}$.

1521

pH	$[\text{H}^+]$	Solution is:
< 7	$> 1.0 \times 10^{-7} \text{ M}$	Acid
= 7	$= 1.0 \times 10^{-7} \text{ M}$	Neutral
> 7	$< 1.0 \times 10^{-7} \text{ M}$	Basic

1522 (a) acidic (b) neutral (c) basic
