

Download File PDF Work Energy Power Answer Sheet

#Jenny

Finally I get this ebook, thanks for all these I can get now!

#Rio

Cool! I'am really happy

#Markus Jensen

I did not think that this would work, my best friend showed me this website, and it does! I get my most wanted eBook

#Hun Tsu

wtf this great ebook for free?!

#Che Salsa

My friends are so mad that they do not know how I have all the high quality ebook which they do not!

#Diego Butler

so many fake sites. this is the first one which worked! Many thanks

Answer Key

Energy, Work, and Power

Energy and work are interrelated—use can make the other.

Energy

Energy is stored work. A battery can store energy to make things work whenever you want. Energy can cause forces, which can cause motion, which can do work.

Work

Work is defined as a force applied (moved) through a distance.

Energy is Work

Energy = Work

Work uses energy. It takes energy to move things. Energy can make things work.

Work uses energy. A generator uses work to make energy, which can be used to do more work.

Work

Work $\rightarrow W = Fd$

If you push harder (more force) you do more work. If you push longer (more distance) you do more work. Work equals force times distance.

To do work, a force has to be in the direction of the motion.

If all of this force does work, it is in the direction of the motion.

If all of this force does work, it is in the direction of the motion.

Power

Power $\rightarrow P = \frac{W}{t}$

How fast you do work is called power. If you work faster, you use more power.

Power equals work divided by time. Putting in the work equation: $P = \frac{Fd}{t}$

A machine that works faster (in less time) is more powerful. A more powerful light bulb gives off the same amount of light (work), but does it faster.

Ex: You do 120 joules of work in 2 seconds. How much power did you use?

$W = 120 \text{ J}$
 $t = 2 \text{ sec}$
 $P = ?$

$P = \frac{W}{t}$
 $P = \frac{120 \text{ J}}{2 \text{ sec}}$
 $P = 60 \text{ watts}$
name of a light bulb

Ex: Two girls lift one 40 N rock up a 3 m staircase. Both girls do it in 10 seconds. How much power did they use?

$F = 40 \text{ N}$
 $d = 3 \text{ m}$
 $t = 10 \text{ sec}$

$W = Fd = 40 \text{ N} \times 3 \text{ m} = 120 \text{ J}$
 $P = \frac{W}{t} = \frac{120 \text{ J}}{10 \text{ sec}} = 12 \text{ W}$

Ex: Two girls lift one 40 N rock up a 3 m staircase. Both girls do it in 10 seconds. How much power did they use?

$F = 40 \text{ N}$
 $d = 3 \text{ m}$
 $t = 10 \text{ sec}$

$W = Fd = 40 \text{ N} \times 3 \text{ m} = 120 \text{ J}$
 $P = \frac{W}{t} = \frac{120 \text{ J}}{10 \text{ sec}} = 12 \text{ W}$

They do the same amount of work (120 J), but both use more power (12 W).
